

**Parallel implementation of FETI-2LM for
large problems with many RHS in CEM**

François-Xavier Roux
Roberto Molina (LJLL, UPMC)

r e t u r n o n i n n o v a t i o n

Summary

- Antenna array problem
- FETI-2LM
- FETI-2LM for Maxwell with Nédélec finite elements
- Acceleration of iterations via reuse of search directions
- Parallel local direct solver
- Block strategy
- Conclusion

Antenna Arrays

- 2D device, attached to the fuselage of the plane
- Complex treatment to orient the radar beam
- Larger arrays for higher intensity
- Fine local mesh to take into account the complex structure of each element

Maxwell equations

Find the diffracted electric field $\vec{E} \in H(\text{curl}; \Omega)$ such that

$$\left\{ \begin{array}{l} \nabla \times \left(\frac{1}{\vec{\mu}_r} \nabla \times \vec{E} \right) - k_0^2 \vec{\epsilon}_r \vec{E} = k_0^2 (\epsilon_{r,i} - \mu_{r,i}^{-1}) \vec{E}_{\text{incident}} \quad \text{in} \quad \Omega \subset \mathbb{R}^3 \\ Z_0 R_e (\vec{n} \times \vec{H}) + \vec{n} \times (\vec{n} \times \vec{E}) = 0 \quad \text{on} \quad \Gamma_r \\ \vec{n} \times \vec{E} = -\vec{n} \times \vec{E}_{\text{incident}} \quad \text{on} \quad \Gamma_e \text{ (PEC)} \\ \vec{n} \times (\nabla \times \vec{E}) + jk_0 \vec{n} \times (\vec{n} \times \vec{E}) = 0 \quad \text{on} \quad \Gamma_{\text{ext}} \end{array} \right.$$

ABC \rightarrow

Isotropic & anisotropic Dielectric materials

Multiple sources:

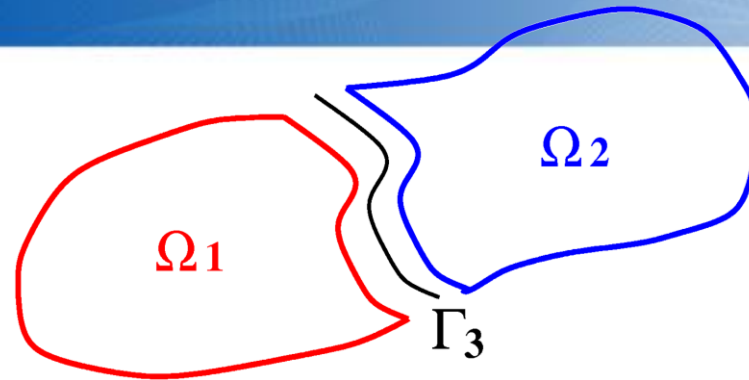

- plane waves
- modes

FEM: Nédélec tetrahedral elements

- Degree 1 (6 dof)
- Degree 2 (20 dof)

Domain decomposition method with Robin interface conditions

- Local Problems with Robin boundary conditions

$$\begin{cases} -\Delta u_1 = f & \text{in } \Omega_1 \\ \frac{\partial u_1}{\partial n_1} + \alpha_1 u_1 = \lambda_1 & \text{on } \Gamma_3 \end{cases}$$

$$\begin{cases} -\Delta u_2 = f_2 & \text{in } \Omega_2 \\ \frac{\partial u_2}{\partial n_2} + \alpha_2 u_2 = \lambda_2 & \text{on } \Gamma_3 \end{cases}$$

- Matching conditions on Γ_3

$$\begin{cases} u_1 - u_2 = 0 \\ \frac{\partial u_1}{\partial n_1} + \frac{\partial u_2}{\partial n_2} = 0 \end{cases} \Leftrightarrow$$

$$\begin{cases} u_1 - u_2 = 0 \\ \lambda_1 - \alpha_1 u_1 + \lambda_2 - \alpha_2 u_2 = 0 \end{cases} \Leftrightarrow$$

$$\begin{cases} \lambda_1 - \alpha_1 u_1 + \lambda_2 - \alpha_2 u_1 = 0 \\ \lambda_1 - \alpha_1 u_2 + \lambda_2 - \alpha_2 u_2 = 0 \end{cases}$$

Application to discrete problems : FETI-2LM method

- Global system of equations

$$\begin{pmatrix} K_{11} & 0 & K_{13} \\ 0 & K_{22} & K_{23} \\ K_{31} & K_{32} & K_{33} \end{pmatrix} \begin{pmatrix} x_1 \\ x_2 \\ x_3 \end{pmatrix} = \begin{pmatrix} b_1 \\ b_2 \\ b_3 \end{pmatrix}$$

- Local system of equations

$$\begin{pmatrix} K_{11} & K_{13} \\ K_{31} & K_{33} + k_1 \end{pmatrix} \begin{pmatrix} x_1 \\ x_3^{(1)} \end{pmatrix} = \begin{pmatrix} b_1 \\ b_3^{(1)} + \lambda_1 \end{pmatrix}$$

$$\begin{pmatrix} K_{22} & K_{23} \\ K_{32} & K_{33} + k_2 \end{pmatrix} \begin{pmatrix} x_2 \\ x_3^{(2)} \end{pmatrix} = \begin{pmatrix} b_2 \\ b_3^{(2)} + \lambda_2 \end{pmatrix}$$

- Interface conditions

$$\begin{cases} x_3^{(1)} = x_3^{(2)} \\ K_{31}x_1 + K_{32}x_2 + K_{33}^{(1)}x_3^{(1)} + K_{33}^{(2)}x_3^{(2)} = b_3 \\ \Leftrightarrow \lambda_1 + \lambda_2 - k_1x_3^{(1)} - k_2x_3^{(2)} = 0 \end{cases}$$

$$\begin{cases} \lambda_1 + \lambda_2 - (k_1 + k_2)x_3^{(2)} = 0 \\ \lambda_1 + \lambda_2 - (k_2 + k_1)x_3^{(1)} = 0 \end{cases}$$

Condensed interface problem

- Local condensation

$$\left(\mathbf{k}_1 + K_{33}^{(1)} - K_{31} K_{11}^{-1} K_{13} \right) \mathbf{x}_3^{(1)} = \boldsymbol{\lambda}_1 + \mathbf{b}_3^{(1)} - K_{31} K_{11}^{-1} \mathbf{b}_1$$

$$\left(\mathbf{k}_2 + K_{33}^{(2)} - K_{32} K_{22}^{-1} K_{23} \right) \mathbf{x}_3^{(2)} = \boldsymbol{\lambda}_2 + \mathbf{b}_3^{(2)} - K_{32} K_{22}^{-1} \mathbf{b}_2$$

- Matrix of interface problem

$$\begin{pmatrix} I & I - (\mathbf{k}_1 + \mathbf{k}_2) \left(\mathbf{k}_2 + K_{33}^{(2)} - K_{32} K_{22}^{-1} K_{23} \right)^{-1} \\ I - (\mathbf{k}_2 + \mathbf{k}_1) \left(\mathbf{k}_1 + K_{33}^{(1)} - K_{31} K_{11}^{-1} K_{13} \right)^{-1} & I \end{pmatrix}$$

FETI-2LM applied to Maxwell

$$\Omega = \Omega_1 \cup \Omega_2 \dots \cup \Omega_N$$

Domain partition

Robin

$$\left\{ \begin{array}{l} \nabla \times \left(\frac{1}{\vec{\mu}_r} \nabla \times \vec{E}_i \right) - k_0^2 \vec{\epsilon}_r \vec{E}_i = k_0^2 (\epsilon_{r,i} - \mu_{r,i}^{-1}) \vec{E}_{incident} \quad \text{in} \quad \Omega_i \subset \mathbb{R}^3 \\ \vec{n}_i \times \left(\frac{1}{\vec{\mu}_{r,i}} \nabla \times \vec{E}_i \right) + jk_0 \vec{n}_i \times (\vec{n}_i \times \vec{E}_i) = \vec{\Lambda}_j^i \quad \text{on} \quad \Gamma_i \quad (\text{Robin}) \\ \vec{n} \times (\nabla \times \vec{E}_i) + jk_0 \vec{n} \times (\vec{n} \times \vec{E}_i) = 0 \quad \text{on} \quad \Gamma_{ext} = \partial\Omega_i \setminus \Gamma_i \end{array} \right.$$

Additional variables on the interface (2 LM method)

Lagrange multipliers with approximate transparent Robin condition (approximate outer Dirichlet-Neumann)

$$\vec{n}_i \times (\mu_{r,i}^{-1} \cdot \nabla \times \vec{E}_i^i) + jk_0 \vec{n}_i \times (\vec{n}_i \times \vec{E}_i^i) = \vec{\Lambda}_j^i$$

Electric and Magnetic field Continuity

$$\vec{n}_j \times (\mu_{r,j}^{-1} \cdot \nabla \times \vec{E}_i^j) + jk_0 \vec{n}_j \times (\vec{n}_j \times \vec{E}_i^j) = \vec{\Lambda}_j^i$$

$$\vec{n}_i \times (\vec{n}_i \times \vec{E}_i^i) = \vec{n}_j \times (\vec{n}_j \times \vec{E}_i^j) \quad (1)$$

$$\vec{n}_i \times (\mu_{r,i}^{-1} \cdot \nabla \times \vec{E}_i^i) = -\vec{n}_j \times (\mu_{r,j}^{-1} \cdot \nabla \times \vec{E}_i^j) \quad (2)$$

$$\Lambda_j^i + \Lambda_i^j - 2jk_0 \vec{n}_i \times (\vec{n}_i \times \vec{E}_j^i) = 0$$

$$\Lambda_j^i + \Lambda_i^j - 2jk_0 \vec{n}_j \times (\vec{n}_j \times \vec{E}_i^j) = 0$$

Krylov subspace method and iterations

$$\begin{cases}
 \Lambda_j^i + \Lambda_i^j - 2jk_0 \vec{n}_i \times \vec{n}_i \times E_j^i = 0 \\
 \Lambda_j^i + \Lambda_i^j - 2jk_0 \vec{n}_j \times \vec{n}_j \times E_i^j = 0
 \end{cases}
 \quad \text{on } \Gamma^{ij}$$

$$\lambda_j^i + \lambda_i^j - (M_j^i + M_i^j)E_j^i = 0 \quad i=1,2,\dots,N_s \quad \text{and} \quad j \in \text{neighbor}(i)$$

$$M_j^i = jk_0 \int_{\Gamma_{ij}} (\vec{n}_i \times \vec{W}_i) \cdot (\vec{n}_i \times \vec{W}_i) dS$$

Computation of $F\lambda - d$

1. Solution of local problem with Robin conditions defined by λ
2. Exchange values of E and λ on interfaces
3. On each interface Γ_i^j , computation of :

$$g_i^j = \lambda_j^i + \lambda_i^j - (M_j^i + M_i^j)E_j^i$$

ORTHODIR iterations until $\| Kx - b \| < \text{stopping criterion}$

Tests on prototype antenna array

- 44x44 array
- 1936 subdomains, 400M unknowns
- Comparison between numerical results and experimental results OK

Weak scalability

- Timings with one subdomain per core
- Increasing size of the array

ORTHODIR algorithm

- ORTHODIR : build a F^*F -orthogonal basis of Krylov space

$$\left\{ \begin{array}{l} g_0 = F\lambda_0 - d \\ v_0 = g_0 \\ Fv_0 \\ d_0 = \|Fv_0\| \end{array} \right. \quad \left\{ \begin{array}{l} \lambda_p = \lambda_{p-1} + \rho_{p-1}v_{p-1} \\ g_p = g_{p-1} + \rho_{p-1}Fv_{p-1} \\ (Fv_{p-1})^* g_p = 0 \Leftrightarrow d_{p-1}\rho_{p-1} = -(Fv_{p-1})^* g_{p-1} \\ \qquad \qquad \qquad - (Fv_{p-1})^* g_0 \end{array} \right. \quad \left\{ \begin{array}{l} v_p = Fv_{p-1} + \sum_0^{p-1} \gamma_{ip} v_i \\ Fv_p = FFv_{p-1} + \sum_0^{p-1} \gamma_{ip} Fv_i \\ \gamma_{ip} = -(Fv_i)^* FFv_{p-1} \\ d_p = \|Fv_p\| \end{array} \right.$$

- ORTHODIR : block formulation

$$V^p = [v_0 v_1 \cdots v_{p-1}], \quad (FV^p)^*(FV^p) = D^p, \quad D^p \rho^p = -(FV^p)^* g_0$$

$$\left\{ \begin{array}{l} \lambda_p = \lambda_0 + V^p \rho^p \\ g_p = g_0 + FV^p \rho^p \end{array} \right. \quad \rho^p = -(FV^p)^* g_0$$

Restarted ORTHODIR with multiple RHS

- V^p and $F V^p$ are given , $(F V^p)^* (F V^p) = D_p$
- Optimal starting λ_0^{opt}

$$\begin{cases} \lambda_0^{opt} = \lambda_0 + V^p \rho^p \\ g_0^{opt} = g_0 + FV^p \rho^p \end{cases} \quad D^p \rho^p = -(FV^p)^* g_0 \Leftrightarrow -(FV^p)^* g_0^{opt} = 0$$

- Start new iterations with new search directions F^*F -orthogonal to V^p
- F^*F -projected ORTHODIR
- In practice same as if restarting ORTHODIR at iteration p
- Accumulation of search directions with successive RHS

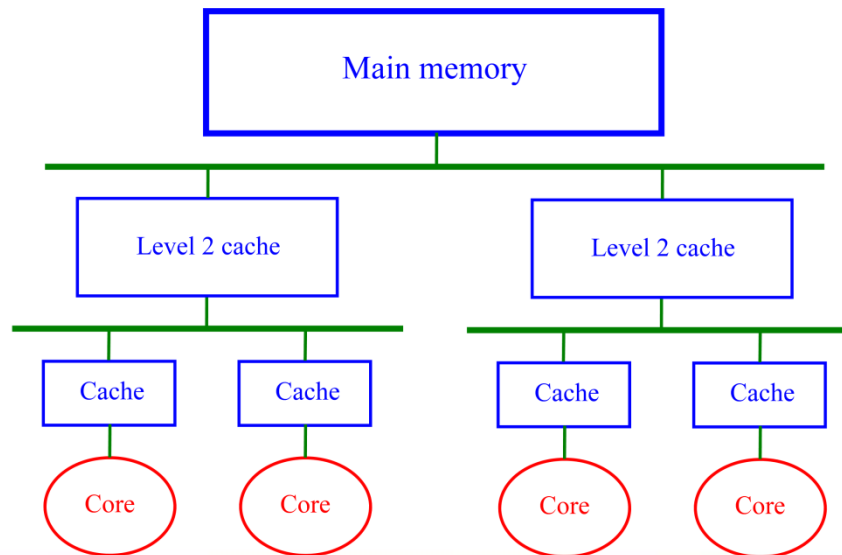

Dependancy upon number of stored directions

- 17x17 array
- 289 subdomains, 50 Million unknowns
- 31 RHS, incident waves with various angles

Computer architecture

- Networked compute nodes
- Each node is a hierarchical memory SMP with possibly parallel co-processor
- Space and time locality of data required for performance
- Present trend: increasing number of cores on each node

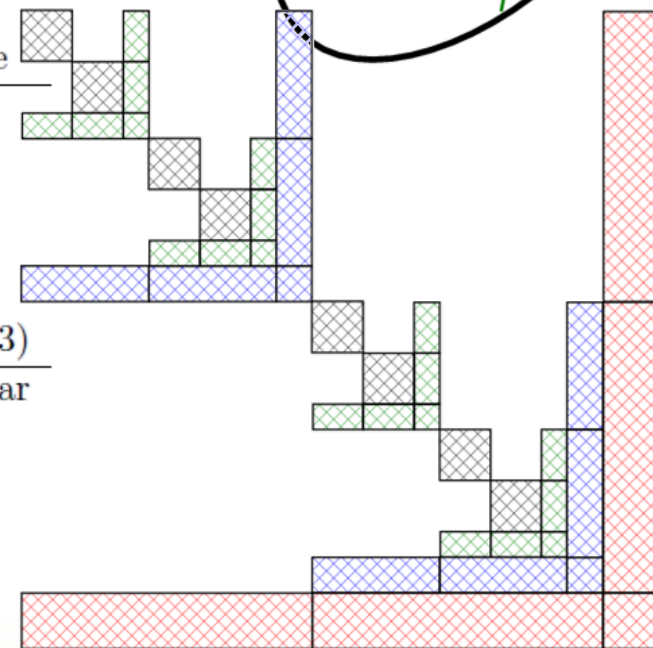

Local direct solver on SMP compute node

- Sparse direct solver based on nested bisection
- P-threads multi-threading management
- Splitting of blocks in small sub-blocks

# cores	Dissection		Pardiso	
	CPU time	elapsed time	CPU	esapsed time
1	74.84	72.824	85.04	82.941
2	74.81	38.162	87.79	43.627
4	77.32	20.454	92.66	23.141
6	79.96	15.200	104.38	17.391
8	83.56	12.008	118.25	14.786

elstct1, $N = 206,763$, nonsingular

DD 23 FX Roux FETI-2LM multiple RHS

Efficiency of multiple forward-backward substitution

- Actual performance limited by global memory access
- Parallelization of forward-backward substitution for a single RHS gives very limited performance (speed-up < 2)
- With multiple RHS, higher arithmetic complexity with same memory access requirement (better data locality)

	1RHS @ 1core	12 RHS @ 12core	efficiency	
Dissection	0.6194 sec.	0.5135 sec	120.6%	
Pardiso	0.7054 sec.	1.2642 sec	55.8%	

- With more than one subdomain per node, memory bandwidth available for each MPI process is even lower
- Performance of each single RHS forward-backward substitution is even poorer

Limited parallel efficiency of restarted ORTHODIR

- One product by F per iteration
- Single RHS local forward-backward substitution
- For numerical stability, use modified Gram-Schmidt procedure for orthogonalization
- dot product (BLAS1) + global reduction via MPI one by one

- Inefficient for local multi-threading on multi-core node
- Large communication overhead

- Use simultaneous solution
 - Keep good properties of restarted ORTHODIR
- } => block ORTHODIR

Block ORTHODIR algorithm

- Block ORTHODIR initialization

$$\begin{cases} \mathbf{g}_0^k = F\lambda_0^k - d^k \\ \mathbf{v}_0^k = \mathbf{g}_0^k \end{cases}, k = 1, n_{block}$$

$$\begin{cases} \Lambda_0 = [\lambda_0^1 \lambda_0^2 \cdots \lambda_0^{n_{block}}] \\ \mathbf{G}_0 = [\mathbf{g}_0^1 \mathbf{g}_0^2 \cdots \mathbf{g}_0^{n_{block}}] \\ \mathbf{V}_0 = [\mathbf{v}_0^1 \mathbf{v}_0^2 \cdots \mathbf{v}_0^{n_{block}}] \\ \mathbf{D}_0 = (F\mathbf{V}_0)^* (F\mathbf{V}_0) = L_0 L_0^* \end{cases}$$

- Block ORTHODIR iteration

$$\begin{cases} \Lambda_p = \Lambda_{p-1} + \mathbf{V}_{p-1} \mathbf{P}_{p-1} \\ \mathbf{G}_p = \mathbf{G}_{p-1} + F\mathbf{V}_{p-1} \mathbf{P}_{p-1} \\ (F\mathbf{V}_{p-1})^* \mathbf{G}_p = 0 \Leftrightarrow \mathbf{D}_{p-1} \mathbf{P}_{p-1} = -(F\mathbf{V}_{p-1})^* \mathbf{G}_{p-1} \end{cases}$$

$$\begin{cases} \mathbf{V}_p = F\mathbf{V}_{p-1} + \sum_0^{p-1} \mathbf{V}_i \Gamma_{ip} \\ F\mathbf{V}_p = FF\mathbf{V}_{p-1} + \sum_0^{p-1} F\mathbf{V}_i \Gamma_{ip} \\ \Gamma_{ip} = -(F\mathbf{V}_i)^* FF\mathbf{V}_{p-1} \\ \mathbf{D}_p = (F\mathbf{V}_p)^* (F\mathbf{V}_p) = L_p L_p^* \end{cases}$$

Block ORTHODIR implementation

- Optimal solution for each RHS using all search directions computed for all RHS
- Rank revealing LL^* factorization of D_p , automatic detection of dependencies between search directions, reduction of number of search directions
- Same property as restarted ORTHODIR in term of decrease of global number of directions to be computed
- n_{block} simultaneous forward-backward substitutions at each iteration, good parallel efficiency on multi-core nodes
- Simultaneous computation of dot products, BLAS3, good parallel efficiency on multi-core nodes, global reduction for a block of scalars at once, reduced MPI overhead
- Restarted block ORTHODIR straightforward

Timings with various multi-RHS strategies

- 17x17 array ; 289 cores, 31 RHS, 50M unknowns

289 CORE	GRID	RHS	STORED DIRECTIONS	ELAPSE TIME(H)	MEMORY/CORE (GB)
50 MILLION DOF					
FIRST RHS	17x17	1	2500	0.96	1.15
INITIAL RHS STRATEGY	17x17	31	2500	3.30	1.15
BLOCK RHS STRATEGY	17x17	31	2500	0.8	1.4

Time / 9

Time / 37

Conclusion

Block ORTHODIR strategy is good for reducing complexity, increasing shared memory parallel efficiency of local direct solver on multi-core node and reducing message passing overhead

Make the design of good preconditioner less important
